

Bubble Sort

Kod

```
#include <stdio.h>
```

define n 5

int main() {

int a[n] = {8, 2, 6, 4, 5}

int i, j, tmp;

for (i = 0; i < n - 1; i++)

for (j = 0; j < n - 1 - i; j++)

if (a[j] > a[j + 1]) {

tmp = a[j];

a[j] = a[j + 1];

a[j + 1] = tmp;

}

for (i = 0; i < n; i++)

printf("%d", a[i]);

printf("\n");

return 0;

}

Çıktı → 2, 4, 5, 6, 8

Selection Sort

ilk önce buna bakıyoruz
ve bütün diziyle sırasıyla
karşılaştırarak kaç tane
büyük olduğuna bakalım 8 4 tane
elementten büyük öyleyse 8'in yeri
5. indistir deriz

Bunu hepisi için yaparız

Bu bize ne kazandırdı
Swap operasyonu yapmadık

Algoritma

→ Bunu bir matris gibi düşünürsek matrisin yarısını tararız yani bubble sort'ta karmaşıklık N^2 iken burdaki karmaşıklık $N^2/2$ olur

Kas yer değıstirme N
olur

Selection Sort kodlama

```
#include <stdio.h>
```

```
#define n 5
```

```
int main() {
```

```
    int a[n] = {9, 1, 5, 2, 8};
```

```
    int i, j, min, tmp;
```

```
    for(i=0; i<n-1; i++) {
```

```
        min = i;
```

```
        for(j=i+1; j<n; j++) {
```

```
            if(a[j] < a[min])
```

```
                min = j;
```

```
        }
```

```
        // swap
```

```
        tmp = a[min];
```

$a[\min] = a[i];$

$a[i] = \text{tmp};$

}

for($i=0; i < n; i++$)

printf("%d", $a[i]$);

printf("\n");

return 0;

}

Insertion Sort algoritmasına bakalım
